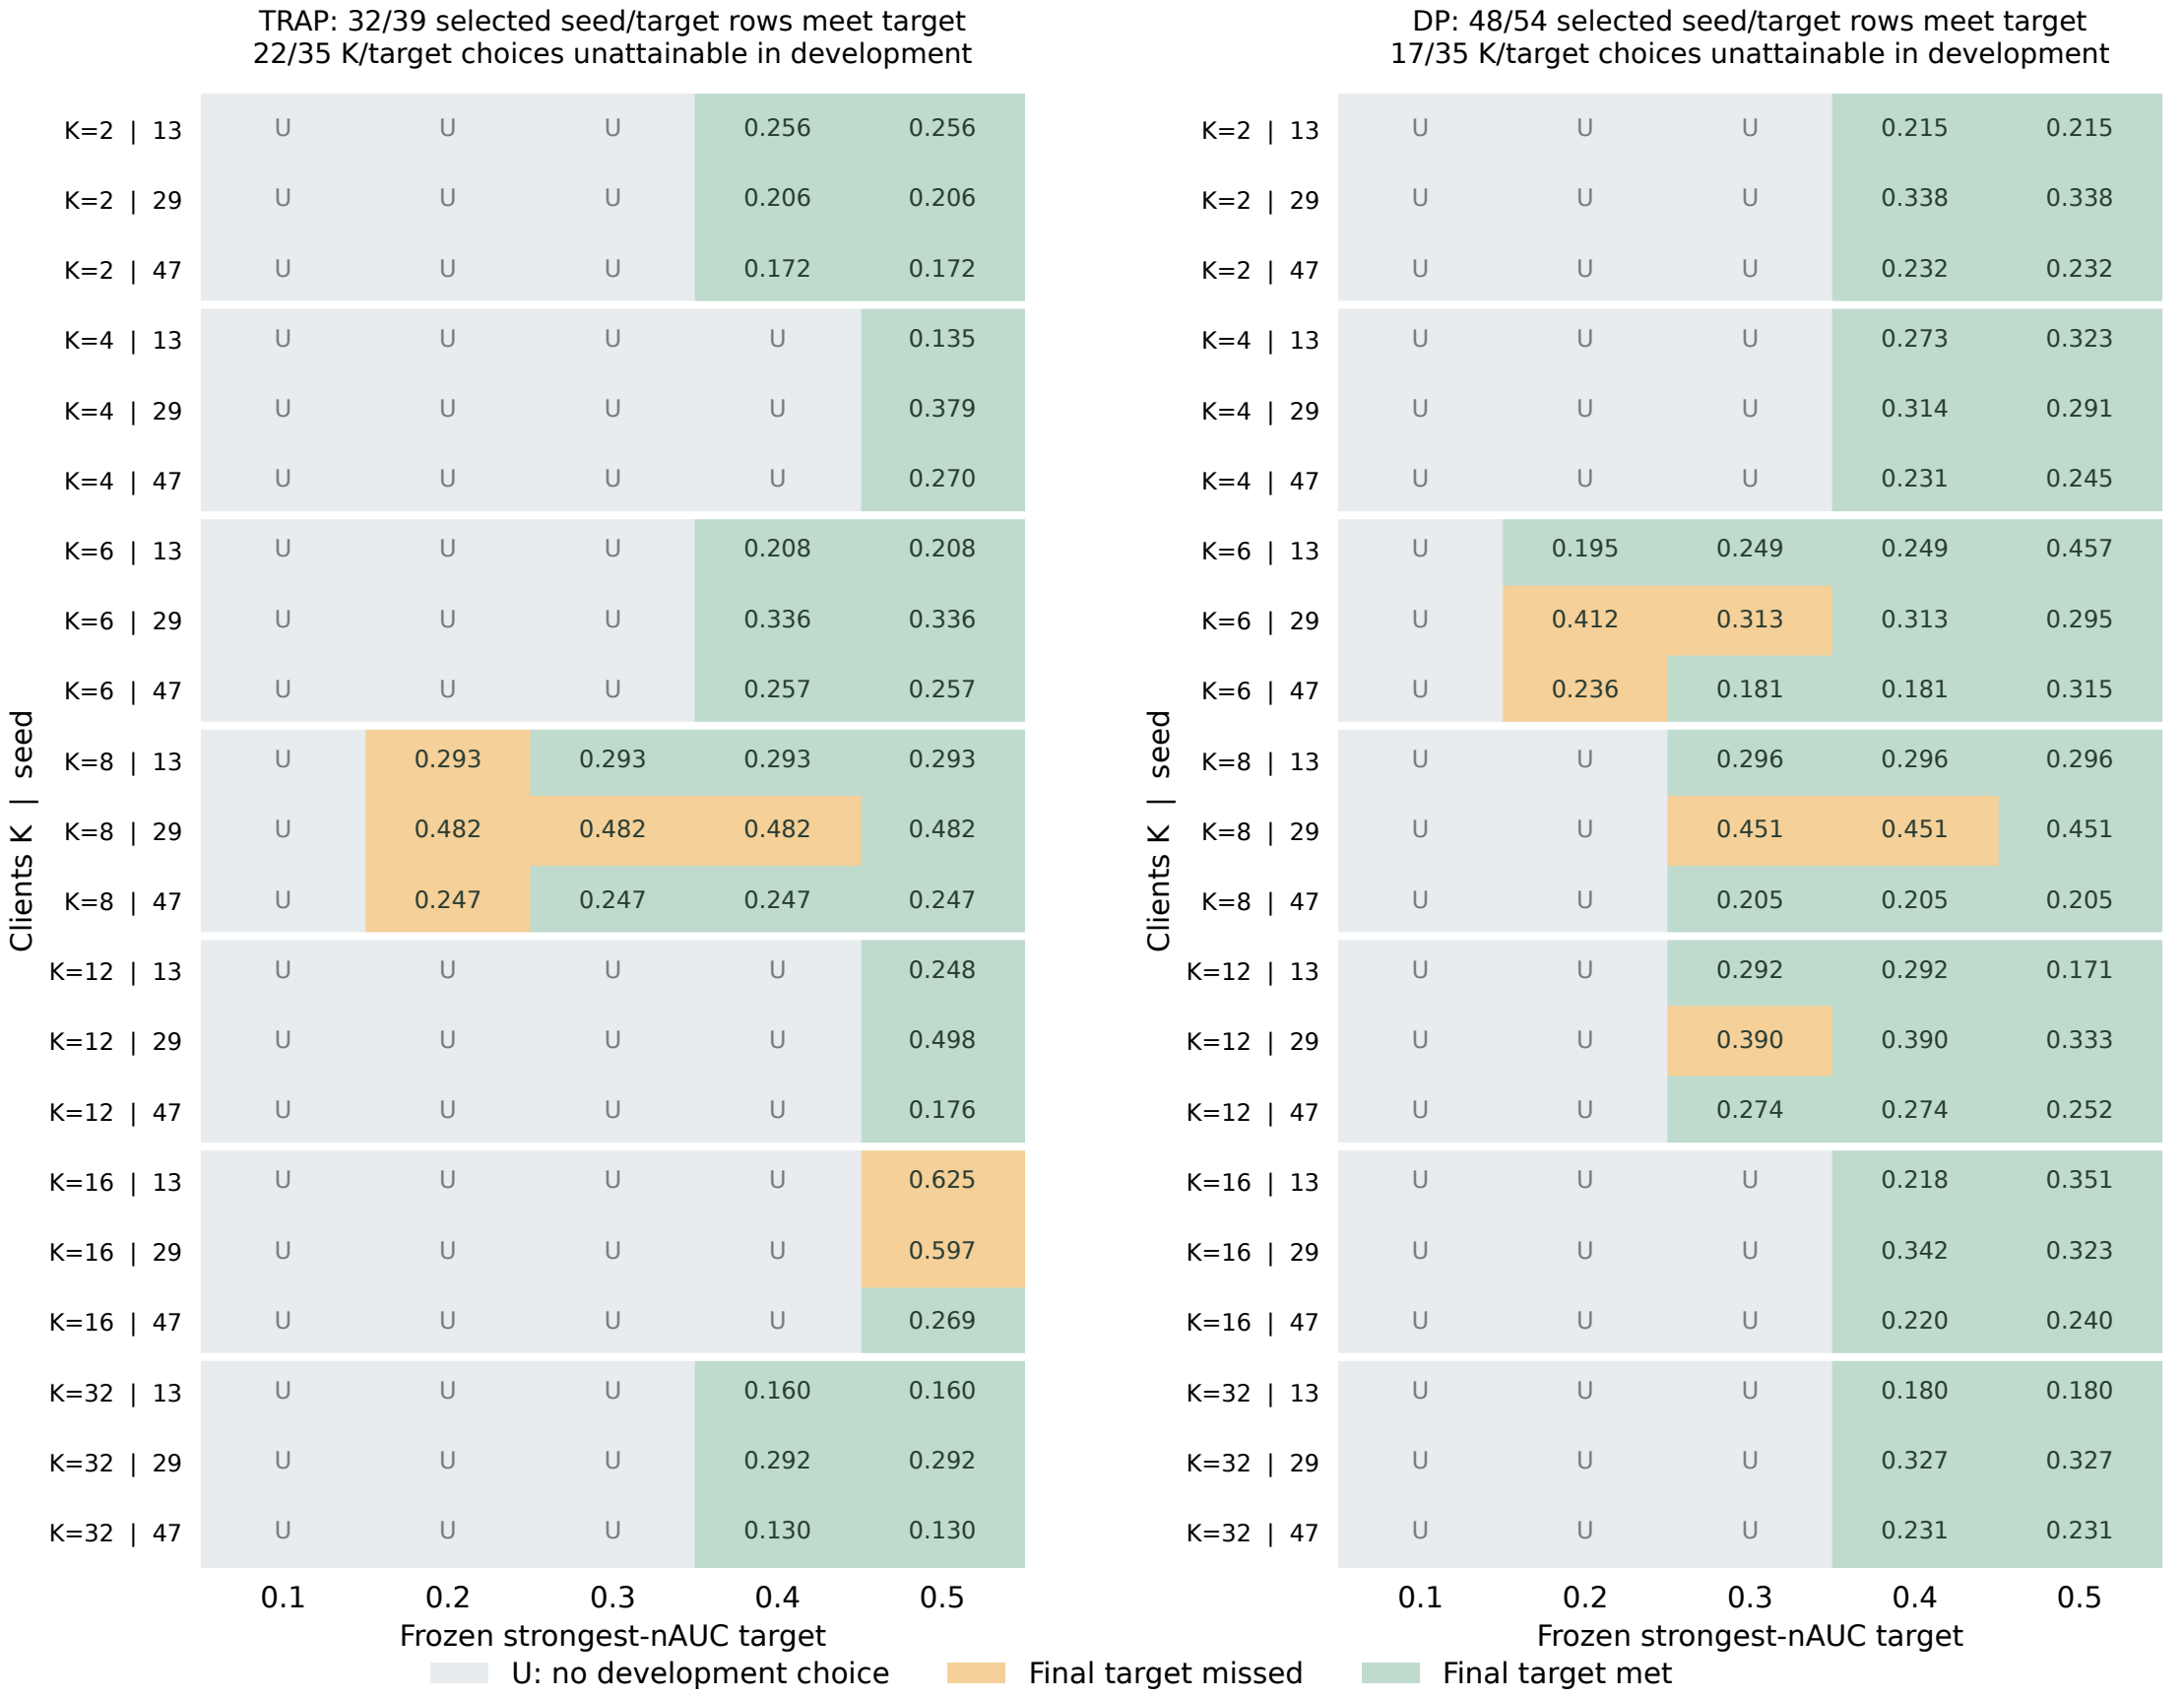
Frozen leakage targets: final attainment

Cells show strongest identifier nAUC at the development-selected strength; lower is better.

Choices were frozen before final evaluation. No final rematching; unavailable targets remain visible.



Seed 13 was used in tuning; seeds 29/47 reuse the frozen choices. The same checkpoint can appear at several targets.

These are observed attack thresholds, not matched formal privacy budgets. Passing a target does not ensure useful accuracy.

All 70 method/K/target choices retained, including 39 unattainable choices. Source: accepted Nov 5, 2026 delivery.
