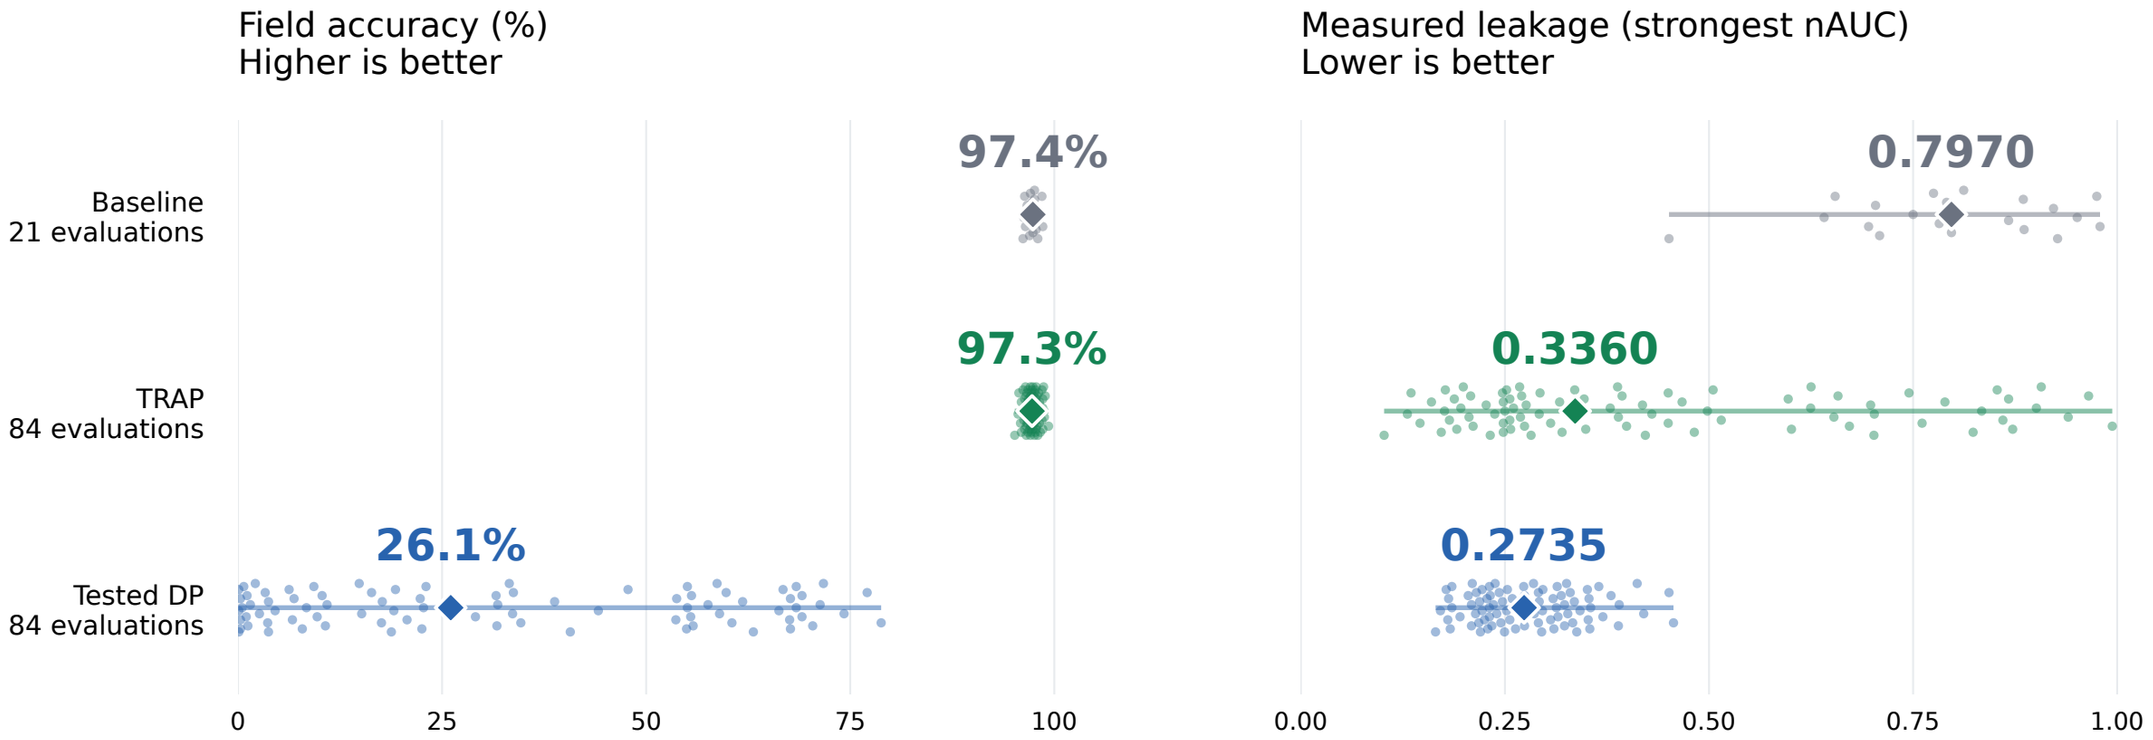
TRAP usually preserved accuracy as measured leakage fell

The tested DP configurations reduced leakage too, but lost substantial accuracy.



60 / 84

TRAP comparisons preserved accuracy and reduced measured leakage.

18.8-98.5 pp

Accuracy lost in all 84 DP comparisons relative to the paired baseline.

Paired criteria: accuracy loss <= 1 percentage point (pp) AND nAUC reduction >= 0.05, at the same K and seed.

Dots = individual evaluations; diamonds / numbers = medians; lines = full ranges, not uncertainty intervals.

Pooled over all 7 client counts, 4 strengths per defense and 3 seeds (13 = tuning). Zero-noise controls are in the full report.

Observed attack scores are not formal privacy guarantees. TRAP has no DP guarantee. Source: accepted Nov 5, 2026 benchmark.
